

Do you smoke now? Have you smoked in the past?

A lung cancer screening could save your life.

A screening called a low-dose CT scan has been approved to help detect lung cancer at an early stage when it's most treatable. Studies have shown that this form of screening can reduce the risk of dying of lung cancer by 20 percent.

You should be screened for lung cancer if you:

- Smoke or smoked a pack of cigarettes a day for 30 or more years or two packs a day for 15 or more years,
- Currently smoke or quit smoking within the last 15 years,
- Are 55 to 80 years of age.

A free lung cancer screening may be available to you if you don't have insurance.
